

Teaching plan | 16 sessions

Econometrics 25117, UPF, 2026–2027

Prepared September 27, 2026. First class: Monday, September 28.

Planning decisions

Your requested total is **16 meetings: 14 teaching sessions and 2 midterms**. The local folder and syllabus list 11 numbered lecture topics, not 12. This plan adds a clearly labeled twelfth topic, integration and cumulative review, instead of inventing a missing lecture deck.

Lecture 1 is split over two meetings so tomorrow's class can establish the foundations carefully. Lecture 10 is split into pooled data/first differences and fixed effects/inference. The other nine existing decks each receive one meeting, and integration receives one: $2 + 2 + 9 + 1 = 14$ teaching meetings.

Calendar limitation: The syllabus gives 18 theory sessions, Midterm 1 on October 26, and Midterm 2 on November 18. This new plan follows your 16-session instruction but does not modify the syllabus. The remaining meeting dates and session duration were not supplied. Session numbers are therefore a proposed sequence, not a verified daily calendar. Only September 28 and the two syllabus midterm dates are labeled. Reconcile how many actual meetings fall before each midterm before announcing the schedule.

Timing assumption: Each teaching guide uses 100 minutes including a short pause. In a shorter slot, use the stated priorities and move optional work to preparation; do not assume that every slide can receive equal time.

File convention: `helpclass1.tex/pdf` through `helpclass16.tex/pdf` refer to *meeting numbers*, not original lecture numbers. Thus `helpclass6` and `helpclass10` are exam-day instructor guides; `helpclass13` and `helpclass14` both use `Lecture10v2.tex`.

Tomorrow's stopping point

Teach `Lecture1v2` from the course introduction through **Correlation**. Stop before **Random Sampling**. Use the worked sunny-day table, density/CDF example, and earnings moments in `helpclass1.pdf`. Session 2 resumes at Random Sampling and finishes the deck.

Assessment alignment

Keep the existing weights: participation 5%, Midterm 1 15%, Midterm 2 20%, cumulative final 60%. Proposed first-midterm scope: Lectures 1–4. Proposed second-midterm scope: Lectures 5–7 with earlier prerequisites. These scopes follow the three-block outline in `Lecture1v2` and remain planning recommendations until confirmed.

Daily allocation | Sessions 1–10

No.	Date	Source	Teach and stop point
1	Sep 28	Lecture 1A	Introduction, random variables, density/CDF, moments, joint/conditional probabilities, iterated expectations, independence, covariance, correlation. Stop before Random Sampling.
2	To confirm	Lecture 1B	Random Sampling through Is your estimator BLUE? Mean/SE, LLN, CLT, estimator properties and least-squares mean.
3	To confirm	Lecture 2	Tests and CIs for means, two-group comparisons, randomized experiments, California illustration.
4	To confirm	Lecture 3	Simple OLS calculation, interpretation, fit, assumptions and sampling properties.
5	To confirm	Lecture 4	Regression inference, software interpretation, heteroskedasticity, robust SEs, Gauss–Markov, review.
6	Oct 26*	Midterm 1	Assessment; proposed coverage Lectures 1–4. No new content.
7	To confirm	Lecture 5	OVb, multiple regression, fit, collinearity, reference groups and controls.
8	To confirm	Lecture 6	Joint tests, classical and robust distinction, linear restrictions, confidence sets.
9	To confirm	Lecture 7	Polynomials, all three log forms, dummy and continuous interactions, Midterm 2 synthesis.
10	Nov 18*	Midterm 2	Assessment; proposed coverage Lectures 5–7, using earlier pre-requisites.

***Midterm dates are from the local syllabus.** Their positions at sessions 6 and 10 are provisional. If the real calendar provides a different number of teaching meetings before those dates, revise the allocation rather than moving an announced exam silently.

Preparation between meetings

Before session 2, redo conditional probabilities and read probability/sampling material (Chapters 1–2). Before session 3, read Chapter 3; before sessions 4 and 5, Chapters 4 and 5. Before sessions 7–9, read Chapters 6–8 respectively. Readings follow the syllabus’s Stock and Watson fourth Global Edition chapter mapping.

Use the guides’ exit tickets as retrieval at the next meeting. The worked examples in the guides have solutions for instructor use; do not distribute those pages as an unseen assessment.

Daily allocation | Sessions 11–16

No.	Date	Source	Teach and stop point
11	To confirm	Lecture 8	Internal/external validity, measurement error, missingness, selection, simultaneity, dependence and prediction.
12	To confirm	Lecture 9	IV assumptions, ratio estimator, 2SLS, empirical examples, weak instruments and exogeneity.
13	To confirm	Lecture 10A	Starting with Pooled Data through Limits of First-Differences. Stop before Fixed Effects Models.
14	To confirm	Lecture 10B	Fixed Effects Models through Final Remarks on Clustered SEs. Within variation, time effects, assumptions, dependence.
15	To confirm	Lecture 11	LPM, logit/probit probabilities, marginal effects, odds and Bernoulli likelihood; one application.
16	To confirm	Added topic 12	Finish model-selection extension, integrated OLS/IV/panel/binary case, cumulative diagnostic and review.

Pacing and coverage safeguards

Lecture 3 Work the OLS calculation and exogeneity carefully. Assign detailed asymptotic variance algebra as review if necessary.

Lecture 7 Use one quadratic, one example of each log form, and one interaction in depth. Repeated interaction figures become self-study; the conceptual categories remain covered.

Lecture 10 Keep the two-meeting split. First differences prepare the within transformation, and clustered inference needs a discussion of the sampling unit.

Lecture 11 A full slide-by-slide treatment will not fit one meeting. Assign extended MLE algebra and repeated output tables. Session 16 explicitly completes model-selection discussion.

If students struggle Use exit-ticket evidence to replace repeated slide illustrations with another worked calculation. Do not use midterm time as overflow. If actual periods are substantially shorter, revise the plan's depth before promising full coverage.

Reading and guide index

Before sessions 11 and 12: Chapters 9 and 12. Before sessions 13–14: Chapter 10 and the relevant Chapter 13 material specified in the syllabus. Before session 15: Chapter 11. Before session 16: review all blocks and the remaining Lecture 11 model-selection slides.

The matching instructor file for every row is `helpclassN.pdf`, with an editable standalone `helpclassN.tex` beside it. Every teaching guide states source boundaries, a timed route, worked examples, and checks with answers. All invented datasets are marked illustrative.

Sources: `Syllabus_2026_2027.tex` and `Lecture1v2.tex` through `Lecture11v2.tex` in the local course folder. No official timetable beyond the supplied syllabus dates was available.
